# Asymptotic Properties of MLE's for Distributions Generated from an Exponential Distribution by a Generalized Log-Logistic Transformation 

James U. Gleaton<br>University of North Florida University of North Florida<br>Dr. Sami Hamid<br>University of North Florida

#### Abstract

A generalized log-logistic (GLL) family of lifetime distributions is one in which any pair of distributions are related through a GLL transformation, for some (non-negative) value of the transformation parameter $\kappa$ (the odds function of the second distribution is the $\kappa$-th power of the odds function of the first distribution). We consider GLL families generated from an exponential distribution. It is shown that the Maximum Likelihood Estimators (MLE's) for the parameters of the generated, or composite, distribution have the properties of strong consistency and asymptotic normality and efficiency. Data simulation is also found to support the condition of asymptotic efficiency.

Keywords Generalized log-logistic exponential distribution; asymptotic properties of MLE's; simulation

[^0]
## 1. Introduction.

Gleaton and Rahman (2010) examined the asymptotic properties of the maximum likelihood estimators for parameters of a distribution generated from a 2-parameter Weibull distribution through a generalized log-logistic (GLL) transformation, defined below. It was shown that, under certain restrictions on the parameter space, the MLE's are strongly consistent and asymptotically normal and efficient.

In an earlier paper, Gleaton and Lynch (2006), discussed properties of lifetime distributions belonging to families generated by a GLL transformation:

$$
G_{\kappa}(x)=\Lambda_{\kappa} \circ G(x)=\frac{(G(x))^{\kappa}}{(G(x))^{\kappa}+(\bar{G}(x))^{\kappa}}, \text { for } x>0
$$

relating two lifetime distribution functions $G(x)$ and $G_{\kappa}(x)$. Here the distribution $G(x)$ may also be a function of an $m$-dimensional non-negative parameter vector $\boldsymbol{\theta}=$ $\left(\theta_{1}, \theta_{2}, \ldots, \theta_{m}\right)$. The transformation is defined for each $\kappa>0$ by

$$
\Lambda_{\kappa}(u)=\left[1+\left(\frac{\bar{u}}{u}\right)^{\kappa}\right]^{-1}, \text { for } 0<u<1
$$

where $\bar{u}=1-u$.
In introducing GLL families of lifetime distributions, Gleaton and Lynch (2006) showed that:

- The set of GLL transformations forms an abelian group with the binary operation of composition.
- The group partitions the set of all lifetime distributions, with any two members of an equivalence class being related to each other through a GLL transformation.
- Either every distribution in an equivalence class has a moment generating function (m.g.f.), or none does, and every distribution in an equivalence class has the same number of moments.
- Each equivalence class is linearly ordered according to the transformation parameter, with larger values of the parameter corresponding to smaller dispersion of a distribution about the common class median.
- The log-odds rates,

$$
\omega_{\kappa}=\frac{d}{d x}\left[\ln \left(G_{\kappa} / \bar{G}_{\kappa}\right)\right]=\kappa \frac{d}{d x}[\ln (G / \bar{G})]=\kappa \omega,
$$

for any two distributions in an equivalence class are the same apart from a multiplicative constant, which is the transformation parameter. The above equation may be taken as the defining characteristic of GLL families.

- Within an equivalence class, the Kullback-Leibler information is an increasing function of the ratio of transformation parameters.
In each equivalence class, one arbitrarily chosen distribution (often taken to be the distribution whose c.d.f. is of simplest form) called the embedded distribution, may be considered the generator of the class. The other distributions in the class are called composite distributions.

Since the introduction of this family of distributions by Gleaton and Lynch (2006), other researchers have extended the family through composition of the GLL transformation with other monotone transformations and have applied the GLL family and the extended families to fitting data sets from various sources.

For example, Cordeiro, et. al. (2017) extended the family by composing the GLL transformation with a power transformation, leading to the generalized odd log-logistic (GOLL) family, which could also be called the GLL-Exponentiated family. They applied this composite transformation to normal, Weibull, and gamma distributions. In each case, they examined quantiles, moments, order statistics, hazard rates, and MLE's. They applied the distribution families to fitting a set of data consisting of lifetimes of a sample of $n=50$ industrial devices. They found that the GOLL-Weibull(2) distribution provided a better fit than a Weibull(2) distribution.

In another example, Cordeiro, et. al. (2015) extended the family by composing the GLL transformation with a Zografos-Balakrishnan (2009) transformation, yielding what they termed a Zografos-Balakrishnan odd log-logistic (ZBOLL) family of distributions. They examined various generating distributions, including the Weibull(2), normal, and Gumbel distributions. They examined quantiles, entropies, order statistics, and MLE's for the resulting families of distributions. They then applied these distributions to two data sets. In the first case, they found that a ZBOLL-Weibull(2) distribution provided a good fit to as set of data consisting of the logarithm of the time to first calving for a sample of $n$ $=897$ female Brazilian Newlore breed cattle. In the second case, the found that ZBOLLNormal distribution provided a good fit to a data set consisting of the daily temperatures for a city in Brazil over a one-year period.

Gleaton and Lynch followed their paper on GLL distributions (2006) with another paper extending the family by composing the GLL transformation with a proportional odds transformation (2010). In this paper, they also found that a GLL-Exponential distribution, the subject of the current paper, provided a better fit than a Weibull(2) distribution to a set of data consisting of the tensile breaking strengths of $n=64$ ten-millimeter-long carbon fibers.

In this paper, we establish sufficient conditions for the asymptotic properties of the MLE's of the parameters of GLL-Exponential distributions, in which the generating distribution is exponential, with c.d.f. given by:

$$
\begin{equation*}
G(x \mid \lambda)=\left(1-e^{-\lambda x}\right) I_{(0, \infty)}(x), \tag{1.1}
\end{equation*}
$$

where $\lambda>0$. The c.d.f. of the transformed distribution is

$$
\begin{equation*}
G_{\kappa}(x \mid \lambda)=\frac{\left(1-e^{-\lambda}\right)^{\kappa}}{\left(1-e^{-\lambda x}\right)^{\kappa}+e^{-\kappa \lambda}} I_{(0, \infty)}(x) \tag{1.2}
\end{equation*}
$$

In Section 2, we present the regularity conditions that must be satisfied for the desired asymptotic properties of the MLE's to hold. In Section 3, we prove a theorem that shows that, if the value of the transformation parameter exceeds 1 , the likelihood equations have a sequence of solutions satisfying conditions of strong consistency and asymptotic normality and efficiency. In Section 4, simulation is used to verify that asymptotic efficiency of the MLE's is satisfied for various values of the parameters. Throughout the following sections, whenever there is no ambiguity, the argument $x$ may be omitted as understood.

## 2. Regularity conditions for asymptotic properties of MLE's.

For a given probability p.d.f. $f(x ; \boldsymbol{\theta})$ depending on an $m$-dimensional parameter vector $\boldsymbol{\theta}$, it is well-known that the MLE's of the parameters of the distribution are jointly strongly consistent and asymptotically normally distributed and efficient if certain regularity conditions are satisfied. The conditions are (Schervish, 1995; Serfling, 1980; Stuart, et. al., 1999; Wijsman, 1973; Wilks, 1962):
a) For almost all $x$, the derivatives

$$
\frac{\partial \ln (f)}{\partial \theta_{i}}, \frac{\partial^{2} \ln (f)}{\partial \theta_{i} \partial \theta_{j}}, \text { and } \frac{\partial^{3} \ln (f)}{\partial \theta_{i} \partial \theta_{j} \partial \theta_{k}}
$$

exist for all values of $\boldsymbol{\theta}$ belonging to a nongenerate open parameter space, $\Omega$.
b) For all $\theta \in \Omega$, where

$$
\left|\frac{\partial f}{\partial \theta_{i}}\right|<F_{1 i}(x),\left|\frac{\partial^{2} f}{\partial \theta_{i} \partial \theta_{j}}\right|<F_{2 i j}(x) \text {, and }\left|\frac{\partial^{3} f}{\partial \theta_{i} \partial \theta_{j} \partial \theta_{k}}\right|<H_{i j k}(x),
$$

the functions $F_{1 i}(x)$ and $F_{2 i j}(x)$ are integrable with respect to $x$ over $(-\infty,+\infty)$, for all $i, j \epsilon\{1,2, \ldots, m\}$, and

$$
\int_{-\infty}^{\infty} H_{i j k}(x) f(x ; \boldsymbol{\theta}) d x<M_{i j k}
$$

where $M_{i j k}$ is positive and independent of $\boldsymbol{\theta}$, for all $i, j, k \in\{1,2, \ldots, m\}$.
c) For all $\boldsymbol{\theta} \in \Omega$,

$$
\int_{-\infty}^{\infty}\left(\frac{\partial \ln (f)}{\partial \theta_{i}}\right)^{2} f(x ; \boldsymbol{\theta}) d x
$$

is positive and finite for $i \epsilon\{1,2, \ldots, m\}$.

## 3. Asymptotic properties of MLE's for distributions generated by a GLL transformation of an exponential distribution.

In this section, the regularity conditions will be verified for the class of continuous lifetime distributions generated from an exponential distribution by a GLL transformation. Throughout, the value of the transformation parameter $\kappa$ is assumed to be greater than 1 .

If the embedded, or generating, distribution for a GLL equivalence class has a p.d.f. of exponential-class form, then the other members of the equivalence class are not members of exponential families, since their p.d.f.'s have the form

$$
\begin{equation*}
g_{\kappa}(x)=\frac{\kappa(G(x) \bar{G}(x))^{\kappa-1} g(x)}{\left[(G(x))^{\kappa}+(\bar{G}(x))^{\kappa}\right]^{2}}=\frac{\kappa \lambda}{G(x)} \Lambda_{\kappa}(G(x)) \Lambda_{\kappa}(\bar{G}(x)), \text { for } x \geq 0 \tag{3.1}
\end{equation*}
$$

It is not possible to write this function in exponential-class form, unless $\kappa=1$.
The hazard rate for the GLLE distribution is then

$$
h_{\kappa}(x)=\frac{g_{\kappa}(x)}{\bar{G}_{\kappa}(x)}=\kappa \Lambda_{\kappa}(G(x)) \frac{g(x)}{G(x) \bar{G}(x)}=\kappa \lambda \frac{G_{\kappa}(x)}{G(x)} .
$$

It is clear that, for $\kappa=1, h_{1}(x)=\lambda$, the exponential hazard rate.

Lemma 3.1: For a $\operatorname{GLLE}(\lambda, \kappa)$ distribution, the first, second, and third partial derivatives of the natural logarithm of the density function with respect to the components of the parameter vector exist for all $x \in(0, \infty)$, for $\kappa>1$.
Proof: Gleaton and Rahman (2010) proved that, for a two-parameter Weibull generating distribution, the first-, second-, and third partial derivatives of the natural logarithm of the GLL-Weibull(2) p.d.f. with respect to the parameters exist for all $x \in(0,+\infty)$ for $\kappa>1$. Since the GLLE distribution is a GLL-Weibull(2) with shape parameter 1, this shows that the first regularity condition holds for GLLE distributions.

Gleaton and Rahman (2010) also showed that the remaining regularity conditions hold for a GLL-Weibull(2) distribution, provided $\kappa>3$. In this paper, the remaining regularity conditions will be addressed for the subset of GLLE distributions, with the restriction on $\kappa$ relaxed.

It is straightforward to show that

$$
\begin{equation*}
\frac{\partial \Lambda_{\kappa}(u)}{\partial \kappa}=\Lambda_{\kappa}(u) \Lambda_{\kappa}(\bar{u}) \ln \left(\frac{u}{\bar{u}}\right) \tag{3.2.a}
\end{equation*}
$$

and that

$$
\begin{equation*}
\frac{\partial \Lambda_{\kappa}(u)}{\partial \lambda}=\kappa \Lambda_{\kappa}(u) \Lambda_{\kappa}(\bar{u}) \frac{\frac{\partial u}{\partial \lambda}}{u \bar{u}} . \tag{3.2.b}
\end{equation*}
$$

### 3.1 First partial derivatives of the density function with respect to the parameters

Lemma 3.2: For a $\operatorname{GLLE}(\lambda, \kappa)$ distribution, the first partial derivatives of the density function with respect to the components of the parameter vector are bounded in absolute value by integrable functions for $\kappa>1$.
Proof: We have, using (3.1) and (3.2.b),

$$
\begin{equation*}
\frac{\partial g_{\kappa}}{\partial \lambda}=\frac{1}{\lambda} g_{\kappa}(x)-x \frac{\bar{G}(x)}{G(x)} g_{\kappa}(x)+\kappa \frac{x}{G(x)}\left(\Lambda_{\kappa}(\bar{G}(x))-\Lambda_{\kappa}(G(x))\right) g_{\kappa}(x) \tag{3.3}
\end{equation*}
$$

Then, for $\kappa>1$, we may use Lemmas 1 and 3 from the Appendix to obtain

$$
\begin{equation*}
\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right| \leq \frac{1}{\lambda} g_{\kappa}(x)+M_{\eta} g_{\kappa}(x)+\kappa 2^{\kappa-1} M_{\eta} g_{\kappa}(x)+\kappa 2^{\kappa-1} x g_{\kappa}(x) \tag{3.4}
\end{equation*}
$$

Since all moments of the composite distribution exist (Gleaton and Lynch, 2006), all terms on the RHS are integrable. Hence, the first partial derivative of the p.d.f. with respect to the scale parameter is bounded in absolute value by an integrable function.

Next, using (3.1) and (3.2.a),

$$
\begin{equation*}
\frac{\partial g_{\kappa}}{\partial \kappa}=\frac{1}{\kappa} g_{\kappa}(x)+g_{\kappa}(x)\left(\Lambda_{\kappa}(\bar{G}(x))-\Lambda_{\kappa}(G(x))\right) \ln \left(\frac{G(x)}{\bar{G}(x)}\right) . \tag{3.5}
\end{equation*}
$$

Using Lemma 1 in the Appendix, we find, for $\kappa>1$,

$$
\begin{gather*}
\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right| \leq \frac{1}{\kappa} g_{\kappa}(x)+2^{\kappa} g_{\kappa}(x)\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| \\
\leq \frac{1}{\kappa} g_{\kappa}(x)+2^{\kappa} g_{\kappa}(x)|\ln (G(x))|+2^{\kappa} g_{\kappa}(x)|\ln (\bar{G}(x))| \tag{3.6}
\end{gather*}
$$

The first term is integrable. Each of the other two terms is integrable by Lemma 4 in the Appendix. Hence, the first partial derivative of the p.d.f. with respect to the transformation parameter is bounded in absolute value by an integrable function for $\kappa>1$.

### 3.2 Second partial derivatives of the density function with respect to the parameters

Lemma 3.3: For a $\operatorname{GLLE}(\lambda, \kappa)$ distribution, the second partial derivatives of the density function with respect to the components of the parameter vector are bounded in absolute value by integrable functions for $\kappa>1$.
PROOF: We have, using (3.3) and (3.2.b),

$$
\begin{gather*}
\frac{\partial^{2} g_{\kappa}}{\partial \lambda^{2}}=-\frac{1}{\lambda^{2}} g_{\kappa}(x)+\frac{1}{\lambda} \frac{\partial g_{\kappa}}{\partial \lambda}+\frac{x^{2} \bar{G}(x)}{(G(x))^{2}} g_{\kappa}(x)-\frac{x \bar{G}(x)}{G(x)} \frac{\partial g_{\kappa}}{\partial \lambda} \\
-\kappa \frac{x^{2} \bar{G}(x)}{(G(x))^{2}}\left(1-2 \Lambda_{\kappa}(G(x))\right) g_{\kappa}(x)-\frac{2 \kappa^{2} x^{2}}{(G(x))^{2}} \Lambda_{\kappa}(G(x)) \Lambda_{\kappa}(\bar{G}(x)) g_{\kappa}(x) \\
+\frac{\kappa x}{G(x)}\left(1-2 \Lambda_{\kappa}(G(x))\right) \frac{\partial g_{\kappa}}{\partial \lambda} . \tag{3.7}
\end{gather*}
$$

Thus, for $\kappa>1$, using Lemmas 1 and 3 in the Appendix,

$$
\begin{align*}
& \left|\frac{\partial^{2} g_{\kappa}}{\partial \lambda^{2}}\right| \leq \frac{1}{\lambda^{2}} g_{\kappa}(x)+\frac{1}{\lambda}\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right|+M_{\nu} g_{\kappa}(x)+M_{\eta}\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right| \\
& +\kappa M_{\nu} g_{\kappa}(x)+\kappa^{2} 2^{2 \kappa-1} M_{v} g_{\kappa}(x)+\frac{\kappa x}{G(x)}\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right| . \tag{3.8}
\end{align*}
$$

The first six terms on the RHS are obviously integrable. We expand the seventh term on the RHS using (3.4). Using (3.1) and Lemmas 1 and 3 in the Appendix and assuming $\kappa>1$, we have

$$
\begin{equation*}
\frac{\kappa x}{G(x)}\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right| \leq \kappa^{2} 2^{2 \kappa-2}\left[M_{\eta}+\lambda M_{\eta}^{2}+\kappa \lambda 2^{\kappa-1} M_{\eta}^{2}+\kappa \lambda 2^{\kappa-1} M_{\eta} x\right] e^{-(\kappa-1) \lambda x} \tag{3.9}
\end{equation*}
$$

The RHS of this inequality is integrable. Thus, for $\kappa>1$, the second partial derivative of the composite p.d.f. with respect to $\lambda$ is bounded in absolute value by an integrable function.

Using (3.5) and (3.2.a), we find that the second partial derivative of the p.d.f. with respect to the transformation parameter is

$$
\begin{align*}
\frac{\partial^{2} g_{\kappa}}{\partial \kappa^{2}}=- & \frac{1}{\kappa^{2}} g_{\kappa}(x)+\frac{1}{\kappa} \frac{\partial g_{\kappa}}{\partial \kappa}+\frac{\partial g_{\kappa}}{\partial \kappa}\left(\Lambda_{\kappa}(\bar{G}(x))-\Lambda_{\kappa}(G(x))\right) \ln \left(\frac{G(x)}{\bar{G}(x)}\right) \\
& -2 g_{\kappa}(x) \Lambda_{\kappa}(G(x)) \Lambda_{\kappa}(\bar{G}(x))\left(\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right)^{2} \tag{3.10}
\end{align*}
$$

Using Lemma 1 in the Appendix, we have

$$
\left|\frac{\partial^{2} g_{\kappa}}{\partial \kappa^{2}}\right| \leq \frac{1}{\kappa^{2}} g_{\kappa}(x)+\frac{1}{\kappa}\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|+\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|
$$

$$
\begin{equation*}
+2^{2 \kappa-1} g_{\kappa}(x) \sum_{j=0}^{2}\binom{2}{j}(\ln (G(x)))^{j}(\ln (\bar{G}(x)))^{2-j} \tag{3.11}
\end{equation*}
$$

The first two terms on the RHS are obviously integrable. Lemma 4 implies that the fourth term on the RHS of (3.11) is integrable.
We expand the derivative in the third term, using (3.6), and also use Lemma 1, obtaining

$$
\begin{equation*}
\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| \leq \frac{1}{\kappa} g_{\kappa}(x)\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|+2^{\kappa} g_{\kappa}(x)\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|^{2} . \tag{3.12}
\end{equation*}
$$

By Lemma 4 in the Appendix, both terms on the RHS of (3.12) are integrable. Hence, the second partial derivative of the p.d.f. with respect to the transformation parameter is bounded in absolute value by an integrable function.

Using (3.5), we find the mixed second partial derivative of the p.d.f.:

$$
\begin{align*}
\frac{\partial^{2} g_{\kappa}}{\partial \lambda \partial \kappa}=\frac{1}{\kappa} \frac{\partial g_{\kappa}}{\partial \lambda}+ & \frac{\partial g_{\kappa}}{\partial \lambda}\left[1-2 \Lambda_{\kappa}(G(x))\right] \ln \left(\frac{G(x)}{\bar{G}(x)}\right)-2 g_{\kappa}(x) \frac{\partial \Lambda_{\kappa}(G(x))}{\partial \lambda} \ln \left(\frac{G(x)}{\bar{G}(x)}\right) \\
& +g_{\kappa}(x)\left[1-2 \Lambda_{\kappa}(G(x))\right]\left(\frac{x \bar{G}(x)}{G(x)}+x\right) \tag{3.13}
\end{align*}
$$

Then, using (3.2.b), we have

$$
\begin{align*}
\left|\frac{\partial^{2} g_{\kappa}}{\partial \lambda \partial \kappa}\right| \leq \frac{1}{\kappa}\left|\frac{\partial g_{\kappa}(x)}{\partial \lambda}\right| & +\left|\frac{\partial g_{\kappa}(x)}{\partial \lambda}\right|\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|+\frac{2}{\lambda} x\left(g_{\kappa}(x)\right)^{2}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| \\
& +g_{\kappa}(x)\left(\frac{x \bar{G}(x)}{G(x)}+x\right) \tag{3.14}
\end{align*}
$$

The first term on the RHS is integrable; using Lemma 3 in the Appendix and the fact that all moments of the distribution exist, we find that the fourth term on the RHS is also integrable. For the second and third terms, if we use (3.4) and Lemma 1 in the Appendix, we have

$$
\begin{align*}
& \quad\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right|\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|+\frac{2}{\lambda} x\left(g_{\kappa}(x)\right)^{2}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| \\
& \leq\left[\frac{1}{\lambda}+M_{\eta}+\kappa 2^{\kappa-1} M_{\eta}+\kappa 2^{\kappa-1} x\right] g_{\kappa}(x)\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| \\
& +\kappa 2^{2 \kappa-1} x g_{\kappa}(x)\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| . \tag{3.15}
\end{align*}
$$

Assuming $\kappa>1$ and using Lemma 4 in the Appendix and (3.1), we find that both terms on the RHS of (3.15) are integrable.

Hence, all second partial derivatives of $g_{\kappa}(x)$ with respect to the parameter components are bounded in absolute value by integrable functions, so long as $\kappa>1$.

### 3.3 Third partial derivatives of the p.d.f. with respect to the parameter components.

Lemma 3.4: For a $\operatorname{GLLE}(\lambda, \kappa)$ distribution, the third partial derivatives of the density function with respect to the components of the parameter vector are bounded in absolute value by functions with finite expectations for $\kappa>1$.
Proof: The third partial derivative of the p.d.f. with respect to the transformation parameter is:

$$
\begin{gather*}
\frac{\partial^{3} g_{\kappa}}{\partial \kappa^{3}}=\frac{2}{\kappa^{3}} g_{\kappa}(x)-\frac{2}{\kappa^{2}} \frac{\partial g_{\kappa}}{\partial \kappa}+\frac{1}{\kappa} \frac{\partial^{2} g_{\kappa}}{\partial \kappa^{2}}+\frac{\partial^{2} g_{\kappa}}{\partial \kappa^{2}}\left[1-2 \Lambda_{\kappa}(G(x))\right] \ln \left(\frac{G(x)}{\bar{G}(x)}\right) \\
-4 \frac{\partial g_{\kappa}}{\partial \kappa} \Lambda_{\kappa}(G(x)) \Lambda_{\kappa}(\bar{G}(x))\left(\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right)^{2} \\
-2 g_{\kappa}(x) \Lambda_{\kappa}(G(x)) \Lambda_{\kappa}(\bar{G}(x))\left[1-2 \Lambda_{\kappa}(G(x))\right]\left(\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right)^{3} \tag{3.16}
\end{gather*}
$$

Hence, for $\kappa>1$, using Lemma 1 in the Appendix and the boundedness of the c.d.f,

$$
\begin{align*}
& \left|\frac{\partial^{3} g_{\kappa}}{\partial \kappa^{3}}\right| \leq \frac{2}{\kappa^{3}} g_{\kappa}(x)+\frac{2}{\kappa^{2}}\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|+\frac{1}{\kappa}\left|\frac{\partial^{2} g_{\kappa}}{\partial \kappa^{2}}\right|+\left|\frac{\partial^{2} g_{\kappa}}{\partial \kappa^{2}}\right|\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| \\
& \quad+2^{2 \kappa}\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|\left(\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right)^{2}+2^{2 \kappa-1} g_{\kappa}(x)\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|^{3} . \tag{3.17}
\end{align*}
$$

The first three terms on the RHS of (3.17) are obviously integrable. Lemma 4 in the Appendix implies that the last term on the RHS of (3.17) is integrable.

Using (3.5), (3.6) and Lemma 1 from the Appendix, we may write the fifth term on the RHS of (3.17) as

$$
\begin{align*}
2^{2 \kappa}\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right| & \left(\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right)^{2} \\
& \leq 2^{2 \kappa}\left[\frac{1}{\kappa} g_{\kappa}(x)+2^{\kappa} g_{\kappa}(x)\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|\right]\left(\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right)^{2} \tag{3.18}
\end{align*}
$$

It is clear from Lemma 4 in the Appendix that the RHS of (3.18) is integrable.
If we expand the fourth term on the RHS of (3.17) using (3.11), we find

$$
\begin{align*}
& \left|\frac{\partial^{2} g_{\kappa}}{\partial \kappa^{2}}\right|\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| \leq \frac{1}{\kappa^{2}} g_{\kappa}(x)\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|+\frac{1}{\kappa}\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| \\
& \quad+\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|^{2}+2^{2 \kappa-1} g_{\kappa}(x)\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|^{3} . \tag{3.19}
\end{align*}
$$

From Lemma 4 in the Appendix, the first and last terms on the RHS of (3.19) are integrable. It was shown above that the second term on the RHS of (3.19) is integrable.
If we expand the third term on the RHS of (3.19) using (3.5) and (3.6), we find

$$
\begin{equation*}
\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|^{2} \leq \frac{1}{\kappa} g_{\kappa}(x)\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|^{2}+2^{\kappa} g_{\kappa}(x)\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|^{3} \tag{3.20}
\end{equation*}
$$

From Lemma 4 in the Appendix, we find that the RHS of (3.20) is integrable.
Hence the third partial derivative of $g_{\kappa}(x)$ with respect to the transformation parameter is bounded in absolute value by an integrable function. Since $g_{\kappa}(x)$ is also bounded by Lemma 1, it follows that $\frac{\partial^{3} g_{\kappa}}{\partial \kappa^{3}}$ is bounded in absolute value by a function with finite expectation.

The third partial derivative of the p.d.f. with respect to the scale parameter is:

$$
\begin{align*}
& \frac{\partial^{3} g_{\kappa}}{\partial \lambda^{3}}= \frac{2}{\lambda^{3}} g_{\kappa}(x)-\frac{2}{\lambda^{2}} \frac{\partial g_{\kappa}}{\partial \lambda}+\frac{1}{\lambda} \frac{\partial^{2} g_{\kappa}}{\partial \lambda^{2}}-\frac{x^{3} \bar{G}(x)}{(G(x))^{3}}(1+\bar{G}(x)) g_{\kappa}(x)+2 \frac{x^{2} \bar{G}(x)}{(G(x))^{2}} \frac{\partial g_{\kappa}}{\partial \lambda} \\
&- \frac{x \bar{G}(x)}{G(x)} \frac{\partial^{2} g_{\kappa}}{\partial \lambda^{2}}+\kappa \frac{x^{3} \bar{G}(x)}{(G(x))^{3}}(1+\bar{G}(x))\left(1-2 \Lambda_{\kappa}(G(x))\right) g_{\kappa}(x) \\
&+\frac{4 \kappa}{\lambda} \frac{x^{3} \bar{G}(x)}{(G(x))^{2}}\left(g_{\kappa}(x)\right)^{2}-2 \kappa \frac{x^{2} \bar{G}(x)}{(G(x))^{2}}\left(1-2 \Lambda_{\kappa}(G(x))\right) \frac{\partial g_{\kappa}}{\partial \lambda} \\
&+\frac{2 \kappa}{\lambda^{2}} \frac{x^{2}}{G(x)}\left(g_{\kappa}(x)\right)^{2}-\frac{6 \kappa}{\lambda} \frac{x^{2}}{G(x)} g_{\kappa}(x) \frac{\partial g_{\kappa}}{\partial \lambda}+\frac{\kappa x}{G(x)}\left(1-2 \Lambda_{\kappa}(G(x))\right) \frac{\partial^{2} g_{\kappa}}{\partial \lambda^{2}} . \tag{3.21}
\end{align*}
$$

Hence, using Lemma 3 in the Appendix and the boundedness of the c.d.f., we find

$$
\begin{align*}
&\left|\frac{\partial^{3} g_{\kappa}}{\partial \lambda^{3}}\right| \leq \frac{2}{\lambda^{3}} g_{\kappa}(x) \\
&+\frac{2}{\lambda^{2}}\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right|+\frac{1}{\lambda}\left|\frac{\partial^{2} g_{\kappa}}{\partial \lambda^{2}}\right|+2(\kappa+1) \frac{x^{3} \bar{G}(x)}{(G(x))^{3}} g_{\kappa}(x)+M_{\eta}\left|\frac{\partial^{2} g_{\kappa}}{\partial \lambda^{2}}\right| \\
&+\frac{4 \kappa}{\lambda} x M_{v}\left(g_{\kappa}(x)\right)^{2}+2(\kappa+1) M_{v}\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right|+\frac{2 \kappa}{\lambda^{2}} \frac{x^{2}}{G(x)}\left(g_{\kappa}(x)\right)^{2}  \tag{3.22}\\
&+\frac{6 \kappa}{\lambda} \frac{x^{2}}{G(x)} g_{\kappa}(x)\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right|+\frac{\kappa x}{G(x)}\left|\frac{\partial^{2} g_{\kappa}}{\partial \lambda^{2}}\right|
\end{align*}
$$

It is clear that terms $1,2,3,5$, and 7 on the RHS of (3.22) are bounded in absolute value by integrable functions, and thus have finite expectations. The other terms will be considered individually.

Assuming $\kappa>1$, we use Lemmas 1 and 3 in the Appendix, together with (3.1) and (3.2.b) to find that the expectation of the absolute value of term 4 on the RHS of (3.22) is

$$
\begin{aligned}
2 \kappa^{2}(\kappa+1) \lambda^{2} & \int_{0}^{\infty} \frac{x^{3}(\bar{G}(x))^{3}}{(G(x))^{3}} \frac{(G(x))^{2 \kappa-2}(\bar{G}(x))^{2 \kappa-2}}{\left[(G(x))^{\kappa}+(\bar{G}(x))^{\kappa}\right]^{4}} d x \\
& \leq \kappa^{2}(\kappa+1) \lambda^{2} 2^{4 \kappa-3} M_{\eta}^{3} \int_{0}^{\infty} e^{-2(\kappa-1) \lambda x} d x \\
& =\frac{\kappa^{2}(\kappa+1) \lambda}{\kappa-1} 2^{4(\kappa-1)} M_{\eta}^{3}
\end{aligned}
$$

Since the p.d.f. is bounded and all moments of the distribution exist, the expectation of term 6 on the RHS of (3.22) is finite.

Assuming $\kappa>1$, we use Lemmas 1 and 3 in the Appendix, together with (3.1) and (3.2.b) to find that the expectation of the absolute value of term 8 on the RHS of (3.22) is

$$
\begin{gathered}
\frac{2 \kappa}{\lambda^{2}} \int_{0}^{\infty} \frac{x^{2}}{G(x)}\left(g_{\kappa}(x)\right)^{3} d x=2 \kappa^{4} \lambda \int_{0}^{\infty} \frac{x^{2} \bar{G}(x)}{G(x)} \frac{(G(x))^{3(\kappa-1)}(\bar{G}(x))^{3 \kappa-1}}{\left[(G(x))^{\kappa}+(\bar{G}(x))^{\kappa}\right]^{6}} d x \\
\quad \leq 2 \kappa^{4} \lambda M_{\rho} 2^{6(\kappa-1)} \int_{0}^{\infty} e^{-(3 \kappa-1) \lambda x} d x=\frac{2 \kappa^{4}}{3 \kappa-1} M_{\rho} 2^{6(\kappa-1)} .
\end{gathered}
$$

Let $\alpha\left(\kappa, \lambda, M_{\eta}\right)=\kappa^{2} 2^{2(\kappa-1)} M_{\eta}\left(1+\lambda M_{\eta}+\kappa \lambda 2^{\kappa-1} M_{\eta}\right)$, and $\beta\left(\kappa, \lambda, M_{\eta}\right)=$ $\kappa^{3} \lambda 2^{3(\kappa-1)} M_{\eta}$. Then, using Lemma 1 in the Appendix and (3.9), we find that the expectation of term 9 on the RHS of (3.22) is

$$
\begin{gather*}
E\left[\frac{6 \kappa}{\lambda} \frac{X^{2}}{G(X)} g_{\kappa}(X)\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right|\right]=\frac{6 \kappa}{\lambda} \int_{0}^{\infty} \frac{x^{2}}{G(x)}\left(g_{\kappa}(x)\right)^{2}\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right| d x \\
\leq \frac{6}{\lambda} \alpha\left(\kappa, \lambda, M_{\eta}\right) \int_{0}^{\infty} x e^{-(\kappa-1) \lambda x}\left(g_{\kappa}(x)\right)^{3} d x+\frac{6}{\lambda} \beta\left(\kappa, \lambda, M_{\eta}\right) \int_{0}^{\infty} x^{2} e^{-(\kappa-1) \lambda x}\left(g_{\kappa}(x)\right)^{3} d x \\
\leq(3) 2^{6 \kappa-5} \kappa^{3} \lambda^{2}\left\{\alpha\left(\kappa, \lambda, M_{\eta}\right) \int_{0}^{\infty} x e^{-(\kappa-1) \lambda x} d x+\beta\left(\kappa, \lambda, M_{\eta}\right) \int_{0}^{\infty} x^{2} e^{-(\kappa-1) \lambda x} d x\right\} .(\mathbf{3 . 2 3}) \tag{3.23}
\end{gather*}
$$

Both integrals on the RHS of (3.23) exist.
Let $C_{1}=\frac{1}{\lambda^{2}}+M_{\nu}\left(\kappa+1+\kappa^{2} 2^{2 \kappa-1}\right)$, and $C_{2}=\frac{1}{\lambda}+M_{\eta}$. Then, using (3.8), we find that the expectation of the tenth term on the RHS of (3.22) is:

$$
\begin{align*}
& E\left[\frac{\kappa X}{G(X)}\left|\frac{\partial^{2} g_{\kappa}}{\partial \lambda^{2}}\right|\right]=\kappa \int_{0}^{\infty} \frac{x}{G(x)} g_{\kappa}(x)\left|\frac{\partial^{2} g_{\kappa}}{\partial \lambda^{2}}\right| d x \leq \kappa C_{1} \int_{0}^{\infty} \frac{x}{G(x)}\left(g_{\kappa}(x)\right)^{2} d x \\
& \quad+\kappa C_{2} \int_{0}^{\infty} \frac{x}{G(x)} g_{\kappa}(x)\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right| d x+\kappa \int_{0}^{\infty} \frac{x^{2}}{(G(x))^{2}} g_{\kappa}(x)\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right| d x . \tag{3.24}
\end{align*}
$$

Using Lemma 5 in the Appendix, we find that the first integral in (3.24) is

$$
\int_{0}^{\infty} \frac{x}{G(x)}\left(g_{\kappa}(x)\right)^{2} d x \leq \kappa^{2} \lambda^{2} 2^{4(\kappa-1)} \int_{0}^{\infty} \frac{x(\bar{G}(x))^{2 \kappa}}{G(x)} d x
$$

which is finite. If we let $C_{3}=\frac{1}{\lambda}+M_{\eta}+\kappa 2^{\kappa-1}$, and $C_{4}=\kappa 2^{\kappa-1}$, and use (3.4), we find that the second integral in (3.24) is

$$
\int_{0}^{\infty} \frac{x}{G(x)} g_{\kappa}(x)\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right| d x \leq C_{3} \int_{0}^{\infty} \frac{x}{G(x)}\left(g_{\kappa}(x)\right)^{2} d x+C_{4} \int_{0}^{\infty} \frac{x^{2}}{G(x)}\left(g_{\kappa}(x)\right)^{2} d x
$$

Lemma 5 in the Appendix implies that both integrals on the RHS of the above equation are finite. Likewise, the last integral on the RHS of (3.24) was shown above to be finite.

Hence, the third partial derivative of the p.d.f. with respect to the scale parameter is bounded in absolute value by a function with finite expectation.

Third mixed partial derivatives. We have

$$
\begin{gathered}
\frac{\partial^{3} g_{\kappa}}{\partial \kappa \partial \lambda^{2}}=-\frac{1}{\lambda^{2}} \frac{\partial g_{\kappa}}{\partial \kappa}+\frac{1}{\lambda} \frac{\partial^{2} g_{\kappa}}{\partial \kappa \partial \lambda}+\frac{x^{2} \bar{G}(x)}{(G(x))^{2}} \frac{\partial g_{\kappa}}{\partial \kappa}-\frac{x \bar{G}(x)}{G(x)} \frac{\partial^{2} g_{\kappa}}{\partial \kappa \partial \lambda} \\
-\frac{x^{2} \bar{G}(x)}{(G(x))^{2}}\left(1-2 \Lambda_{\kappa}(G(x))\right) g_{\kappa}(x)+2 \kappa \frac{x^{2} \bar{G}(x)}{(G(x))^{2}} \Lambda_{\kappa}(G(x)) \Lambda_{\kappa}(\bar{G}(x)) \ln \left(\frac{G(x)}{\bar{G}(x)}\right) g_{\kappa}(x) \\
-\frac{\kappa x^{2} \bar{G}(x)}{(G(x))^{2}}\left(1-2 \Lambda_{\kappa}(G(x))\right) \frac{\partial g_{\kappa}}{\partial \kappa}-\frac{4 \kappa x^{2}}{(G(x))^{2}} \Lambda_{\kappa}(G(x)) \Lambda_{\kappa}(\bar{G}(x)) g_{\kappa}(x) \\
-\frac{2 \kappa^{2} x^{2}}{(G(x))^{2}} \Lambda_{\kappa}(G(x))\left(\Lambda_{\kappa}(\bar{G}(x))\right)^{2} \ln \left(\frac{G(x)}{\bar{G}(x)}\right) g_{\kappa}(x)
\end{gathered}
$$

$$
\begin{gather*}
+\frac{2 \kappa^{2} x^{2}}{(G(x))^{2}}\left(\Lambda_{\kappa}(G(x))\right)^{2} \Lambda_{\kappa}(\bar{G}(x)) \ln \left(\frac{G(x)}{\bar{G}(x)}\right) g_{\kappa}(x)-\frac{2 \kappa^{2} x^{2}}{(G(x))^{2}} \Lambda_{\kappa}(G(x)) \Lambda_{\kappa}(\bar{G}(x)) \frac{\partial g_{\kappa}}{\partial \kappa} \\
+\frac{x}{G(x)}\left(1-2 \Lambda_{\kappa}(G(x))\right) \frac{\partial g_{\kappa}}{\partial \lambda}-2 \frac{\kappa x}{G(x)} \Lambda_{\kappa}(G(x)) \Lambda_{\kappa}(\bar{G}(x)) \ln \left(\frac{G(x)}{\bar{G}(x)}\right) \frac{\partial g_{\kappa}}{\partial \lambda} \\
+\frac{\kappa x}{G(x)}\left(1-2 \Lambda_{\kappa}(G(x))\right) \frac{\partial^{2} g_{\kappa}}{\partial \kappa \partial \lambda} \tag{3.25}
\end{gather*}
$$

Then, using Lemmas 1 and 3 in the Appendix, we find

$$
\begin{gather*}
\left|\frac{\partial^{3} g_{\kappa}}{\partial \kappa \partial \lambda^{2}}\right| \leq \frac{1}{\lambda^{2}}\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|+\frac{1}{\lambda}\left|\frac{\partial^{2} g_{\kappa}}{\partial \kappa \partial \lambda}\right|+M_{v}\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|+M_{\eta}\left|\frac{\partial^{2} g_{\kappa}}{\partial \kappa \partial \lambda}\right| \\
+M_{\nu} g_{\kappa}(x)+2^{2 \kappa-1} \kappa M_{v}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| g_{\kappa}(x)+\kappa M_{v}\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|+2^{2 \kappa} \kappa M_{\nu} g_{\kappa}(x) \\
+2^{3 \kappa-1} \kappa^{2} M_{v}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| g_{\kappa}(x)+2^{2 \kappa-1} \kappa^{2} M_{v}\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|+\frac{x}{G(x)}\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right| \\
+2^{2 \kappa-1} \kappa \frac{x}{G(x)}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right|+\kappa \frac{x}{G(x)}\left|\frac{\partial^{2} g_{\kappa}}{\partial \kappa \partial \lambda}\right| . \tag{3.26}
\end{gather*}
$$

The first, second, third, fourth, fifth, seventh, eighth, and tenth terms on the RHS of (3.26) are clearly integrable. Lemma 4 in the Appendix implies that the sixth and ninth terms are also integrable. Hence, all of these terms have finite expectations.

Using (3.4), we find that the expectation of the eleventh term is

$$
\begin{aligned}
E\left[\frac{X}{G(X)}\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right|\right] & \leq\left(\frac{1}{\lambda}+M_{\eta}+\kappa 2^{\kappa-1} M_{\eta}\right) \int_{0}^{\infty} \frac{x}{G(x)}\left(g_{\kappa}(x)\right)^{2} d x \\
& +\kappa 2^{\kappa-1} \int_{0}^{\infty} \frac{x^{2}}{G(x)}\left(g_{\kappa}(x)\right)^{2} d x
\end{aligned}
$$

Applying (3.1) and Lemmas 1 and 3 in the Appendix, we find

$$
E\left[\frac{X}{G(X)}\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right|\right] \leq \kappa \lambda 2^{2(\kappa-1)} M_{\eta}\left(\frac{1}{\lambda}+M_{\eta}+\kappa 2^{\kappa-1} M_{\eta}\right)+\kappa^{2} \lambda 2^{3(\kappa-1)} M_{\eta} E[X] .
$$

The expectation of the twelfth term is

$$
2^{2 \kappa-1} \kappa E\left[\frac{X}{G(X)}\left|\ln \left(\frac{G(X)}{\bar{G}(X)}\right)\right|\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right|\right]=2^{2 \kappa-1} \kappa \int_{0}^{\infty} \frac{x}{G(x)}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right| g_{\kappa}(x) d x
$$

Using (3.4), we find

$$
\begin{gather*}
E\left[\frac{X}{G(X)}\left|\ln \left(\frac{G(X)}{\bar{G}(X)}\right)\right|\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right|\right] \leq\left(\frac{1}{\lambda}+M_{\eta}+\kappa 2^{\kappa-1} M_{\eta}\right) \int_{0}^{\infty} \frac{x}{G(x)}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|\left(g_{\kappa}(x)\right)^{2} d x \\
+\kappa 2^{\kappa-1} \int_{0}^{\infty} \frac{x^{2}}{G(x)}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|\left(g_{\kappa}(x)\right)^{2} d x \tag{3.27}
\end{gather*}
$$

If we apply (3.1) and Lemma 1 in the Appendix, we find the first integral on the RHS of (3.27) is

$$
\int_{0}^{\infty} \frac{x}{G(x)}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|\left(g_{\kappa}(x)\right)^{2} d x \leq \kappa \lambda 2^{2(\kappa-1)} M_{\eta} \int_{0}^{\infty}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| g_{\kappa}(x) d x .
$$

The integral on the RHS above exists, by Lemma 4 in the Appendix. Similarly, the second integral on the RHS of (3.27) is

$$
\int_{0}^{\infty} \frac{x^{2}}{G(x)}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|\left(g_{\kappa}(x)\right)^{2} d x \leq \kappa \lambda 2^{2(\kappa-1)} M_{\eta} \int_{0}^{\infty} x\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| g_{\kappa}(x) d x
$$

Again, Lemma 4 in the Appendix implies that the integral on the RHS above exists.
The expectation of the thirteenth term on the RHS of (3.26) is

$$
E\left[\kappa \frac{X}{G(X)}\left|\frac{\partial^{2} g_{\kappa}}{\partial \kappa \partial \lambda}\right|\right]=\kappa \int_{0}^{\infty} \frac{x}{G(x)}\left|\frac{\partial^{2} g_{\kappa}}{\partial \kappa \partial \lambda}\right| g_{\kappa}(x) d x
$$

Using (3.14), we find

$$
\begin{gather*}
E\left[\kappa \frac{X}{G(X)}\left|\frac{\partial^{2} g_{\kappa}}{\partial \kappa \partial \lambda}\right|\right] \leq E\left[\frac{X}{G(X)}\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right|\right]+\kappa E\left[\frac{X}{G(X)}\left|\ln \left(\frac{G(X)}{\bar{G}(X)}\right)\right|\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right|\right] \\
+\frac{2 \kappa}{\lambda} \int_{0}^{\infty} \frac{x^{2}}{G(x)}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|\left(g_{\kappa}(x)\right)^{3} d x \\
+\kappa \int_{0}^{\infty} \frac{x}{G(x)}\left(x+\frac{x \bar{G}(x)}{G(x)}\right)\left(g_{\kappa}(x)\right)^{2} d x . \tag{3.28}
\end{gather*}
$$

It was shown above that the first two terms on the RHS of (3.28) are finite. For the third term on the RHS of (3.28), if we use (3.1) and Lemmas 1 and 3 in the Appendix, we have

$$
\begin{equation*}
\frac{2 \kappa}{\lambda} \int_{0}^{\infty} \frac{x^{2}}{G(x)}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|\left(g_{\kappa}(x)\right)^{3} d x \leq \kappa^{3} \lambda 2^{4 \kappa-3} M_{v} \int_{0}^{\infty}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| g_{\kappa}(x) d x \tag{3.29}
\end{equation*}
$$

The fourth term on the RHS of (3.28) may be written, using (3.1) and Lemmas 1 and 3 in the Appendix, as

$$
\begin{aligned}
\kappa \int_{0}^{\infty} \frac{x^{2}}{(G(x))^{2}}\left(g_{\kappa}(x)\right)^{2} d x= & \kappa^{2} \lambda \int_{0}^{\infty} \frac{x^{2}}{(G(x))^{3}} \Lambda_{\kappa}(G(x)) \Lambda_{\kappa}(\bar{G}(x)) g_{\kappa}(x) d x \\
& \leq \kappa^{2} \lambda 2^{2(\kappa-1)} M_{v} .
\end{aligned}
$$

Hence, $\left|\frac{\partial^{3} g_{\kappa}}{\partial \kappa \partial \lambda^{2}}\right|$ is bounded by a function with finite expectation.
Finally, using (3.10), we find

$$
\begin{gathered}
\frac{\partial^{3} g_{\kappa}}{\partial \lambda \partial \kappa^{2}}=-\frac{1}{\kappa^{2}} \frac{\partial g_{\kappa}}{\partial \lambda}+\frac{1}{\kappa} \frac{\partial^{2} g_{\kappa}}{\partial \lambda \partial \kappa}-\frac{2}{\lambda} x g_{\kappa}(x) \frac{\partial g_{\kappa}}{\partial \kappa} \ln \left(\frac{G(x)}{\bar{G}(x)}\right) \\
+\left(1-2 \Lambda_{\kappa}(G(x))\right) \frac{\partial^{2} g_{\kappa}}{\partial \lambda \partial \kappa} \ln \left(\frac{G(x)}{\bar{G}(x)}\right)+\frac{x}{G(x)}\left(1-2 \Lambda_{\kappa}(G(x))\right) \frac{\partial g_{\kappa}}{\partial \kappa} \\
-\frac{2}{\kappa \lambda} x \bar{G}(x)\left(g_{\kappa}(x)\right)^{2}\left(\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right)^{2}-\frac{4}{\kappa \lambda} G(x) g_{\kappa}(x) \frac{\partial g_{\kappa}}{\partial \lambda}\left(\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right)^{2}
\end{gathered}
$$

$$
\begin{equation*}
-\frac{4}{\kappa \lambda} x\left(g_{\kappa}(x)\right)^{2} \ln \left(\frac{G(x)}{\bar{G}(x)}\right) \tag{3.30}
\end{equation*}
$$

Hence,

$$
\begin{align*}
& \left|\frac{\partial^{3} g_{\kappa}}{\partial \lambda \partial \kappa^{2}}\right| \leq \frac{1}{\kappa^{2}}\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right|+\frac{1}{\kappa}\left|\frac{\partial^{2} g_{\kappa}}{\partial \lambda \partial \kappa}\right|+\frac{2}{\lambda} x g_{\kappa}(x)\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| \\
+ & \left|\frac{\partial^{2} g_{\kappa}}{\partial \lambda \partial \kappa}\right|\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|+\frac{x}{G(x)}\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|+\frac{2}{\kappa \lambda} x\left(g_{\kappa}(x)\right)^{2}\left(\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right)^{2} \\
+ & \frac{4}{\kappa \lambda} g_{\kappa}(x)\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right|\left(\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right)^{2}+\frac{4}{\kappa \lambda} x\left(g_{\kappa}(x)\right)^{2}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| . \tag{3.31}
\end{align*}
$$

The first two terms on the RHS of (3.31) are bounded by integrable functions, and thus have finite expectations. The boundedness of the p.d.f., together with Lemma 4 in the Appendix, imply that the sixth and eighth terms on the RHS of (3.31) are bounded by integrable functions, and thus have finite expectations.

Using the fact that the p.d.f. is bounded, we find that the expectation of the third term on the RHS of (3.31) is

$$
\begin{gathered}
\frac{2}{\lambda} E\left[X g_{\kappa}(X)\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|\left|\ln \left(\frac{G(X)}{\bar{G}(X)}\right)\right|\right] \leq \kappa \lambda 2^{4 \kappa-3} \int_{0}^{\infty} x g_{\kappa}(x)\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| d x \\
+\kappa^{2} \lambda 2^{5 \kappa-3} \int_{0}^{\infty} x g_{\kappa}(x)\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|^{2} d x
\end{gathered}
$$

which is finite by Lemma 4 in the Appendix.
Using (3.14), we find that the expectation of the fourth term on the RHS of (3.31) is

$$
\begin{align*}
& \int_{0}^{\infty}\left|\frac{\partial^{2} g_{\kappa}}{\partial \lambda \partial \kappa}\right|\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| g_{\kappa}(x) d x \leq \frac{1}{\kappa} \int_{0}^{\infty}\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| g_{\kappa}(x) d x \\
&+ \int_{0}^{\infty}\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|^{2} g_{\kappa}(x) d x+\frac{2}{\lambda} \int_{0}^{\infty} x\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|^{2}\left(g_{\kappa}(x)\right)^{3} d x \\
&+\int_{0}^{\infty} x\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|\left(g_{\kappa}(x)\right) d x+\int_{0}^{\infty} \frac{x \bar{G}(x)}{G(x)}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|\left(g_{\kappa}(x)\right)^{2} d x . \tag{3.32}
\end{align*}
$$

It was shown above that the first term - see (3.12) - and the second term - see (3.20) on the RHS of (3.31) are finite.

Using (3.6), we find that the expectation of the fifth term on the RHS of (3.31) is

$$
\begin{aligned}
E\left[\frac{X}{G(X)}\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|\right] & =\int_{0}^{\infty} \frac{x}{G(x)}\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right| g_{\kappa}(x) d x \leq \frac{1}{\kappa} \int_{0}^{\infty} \frac{x}{G(x)}\left(g_{\kappa}(x)\right)^{2} d x \\
& +2^{\kappa} \int_{0}^{\infty} \frac{x}{G(x)}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right|\left(g_{\kappa}(x)\right)^{2} d x
\end{aligned}
$$

Using (3.6) and Lemmas 1 and 3 in the Appendix, we find

$$
E\left[\frac{X}{G(X)}\left|\frac{\partial g_{\kappa}}{\partial \kappa}\right|\right] \leq \lambda 2^{2(\kappa-1)} M_{\eta}+\kappa \lambda 2^{3 \kappa-2} M_{\eta} \int_{0}^{\infty}\left|\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right| g_{\kappa}(x) d x
$$

The integral on the RHS above exists, by Lemma 4 in the Appendix. Hence, the fifth term on the RHS of (3.31) is bounded by an integrable function.

Using (3.1), (3.4), and Lemmas 1 and 3 in the Appendix, we find that the expectation of the seventh term on the RHS of (3.31) is

$$
\begin{gathered}
\frac{4}{\kappa \lambda} \int_{0}^{\infty}\left|\frac{\partial g_{\kappa}}{\partial \lambda}\right|\left(\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right)^{2}\left(g_{\kappa}(x)\right)^{2} d x \\
\leq \kappa \lambda 2^{4 \kappa-2}\left(\frac{1}{\lambda}+M_{\eta}+2^{\kappa-1} M_{\eta}\right) \int_{0}^{\infty}\left(\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right)^{2} g_{\kappa}(x) d x \\
+\kappa^{2} \lambda 2^{5 \kappa-3} \int_{0}^{\infty} x\left(\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right)^{2} g_{\kappa}(x) d x .
\end{gathered}
$$

Then, Lemma 4 in the Appendix implies that the integrals on the RHS above are finite. Thus, the expectation of the seventh term is bounded by an integrable function.

Hence, the eighth term on the RHS of (3.31) is bounded by a function with finite expectation.

Thus, $\frac{\partial^{3} g_{\kappa}}{\partial \lambda \partial \kappa^{2}}$ is bounded in absolute value by a function with finite expectation.

### 3.4. Expectation of the squares of the first partial derivatives of the logarithm of the p.d.f. with respect to the two parameters

Lemma 3.5: For a $\operatorname{GLLE}(\lambda, \kappa)$ distribution, the expectation of the square of the natural logarithm of the density function with respect to each component of the parameter vector is positive and finite for $\kappa>1$.
Proof: From (3.1), we have

$$
\frac{\partial \ln \left(g_{\kappa}(x)\right)}{\partial \kappa}=\frac{1}{\kappa}+\left(1-2 \Lambda_{\kappa}(G(x))\right) \ln \left(\frac{G(x)}{\bar{G}(x)}\right) .
$$

Then, using Lemma 4 in the Appendix, we find that

$$
E\left[\left(\frac{\partial \ln \left(g_{\kappa}(X)\right)}{\partial \kappa}\right)^{2}\right] \leq \frac{1}{\kappa^{2}}+\frac{2}{\kappa} \int_{0}^{\infty} \ln \left(\frac{G(x)}{\bar{G}(x)}\right) g_{\kappa}(x) d x+\int_{0}^{\infty}\left(\ln \left(\frac{G(x)}{\bar{G}(x)}\right)\right)^{2} g_{\kappa}(x) d x
$$

is finite.
Also from (3.1), we have

$$
\frac{\partial \ln \left(g_{\kappa}(x)\right)}{\partial \lambda}=\frac{1}{\lambda}-\frac{x \bar{G}(x)}{G(x)}+\frac{\kappa x}{G(x)}\left(1-2 \Lambda_{\kappa}(G(x))\right)
$$

Thus, by Lemma 3 in the Appendix, we have

$$
\left|\frac{\partial \ln \left(g_{\kappa}(x)\right)}{\partial \lambda}\right| \leq \frac{1}{\lambda}+M_{\eta}+\frac{\kappa x}{G(x)^{\prime}}
$$

and

$$
\begin{aligned}
E\left[\left(\frac{\partial \ln \left(g_{\kappa}(X)\right)}{\partial \lambda}\right)^{2}\right] & \leq\left(\frac{1}{\lambda}+M_{\eta}\right)^{2}+2 \kappa\left(\frac{1}{\lambda}+M_{\eta}\right) \int_{0}^{\infty} \frac{x}{G(x)} g_{\kappa}(x) d x \\
& +\kappa^{2} \int_{0}^{\infty} \frac{x^{2}}{(G(x))^{2}} g_{\kappa}(x) d x
\end{aligned}
$$

Using (3.1) and Lemmas 1 and 3 in the Appendix, we find that the first integral on the RHS above is

$$
\int_{0}^{\infty} \frac{x}{G(x)} g_{\kappa}(x) d x \leq \kappa \lambda M_{\eta} 2^{2(\kappa-1)} \int_{0}^{\infty} e^{-(\kappa-1) \lambda x} d x=\frac{\kappa M_{\eta} 2^{2(\kappa-1)}}{\kappa-1}
$$

Also using (3.1) and Lemmas 1 and 3 in the Appendix, we find that the second integral on the RHS above is

$$
\int_{0}^{\infty} \frac{x^{2}}{(G(x))^{2}} g_{\kappa}(x) d x \leq \kappa \lambda M_{\nu} 2^{2(\kappa-1)} \int_{0}^{\infty} e^{-(\kappa-1) \lambda x} d x=\frac{\kappa M_{v} 2^{2(\kappa-1)}}{\kappa-1}
$$

Thus the last regularity condition is satisfied for $\kappa>1$.

### 3.5. Asymptotic properties theorem

As a result of the five preceding lemmas in this section, we may state (Schervish, 1995; Serfling, 1980; Stuart, et. al., 1999; Wijsman, 1973; Wilks, 1962) the following theorem.

Theorem: If $X_{1}, X_{2}, \ldots, X_{n}$ is a random sample from a distribution which is Generalized Log-Logistic Exponential, with scale parameter $\lambda>0$ and transformation parameter $\kappa>1$, then with probability 1 , the likelihood equations admit a sequence of solutions $\left\{\widehat{\boldsymbol{\theta}}_{n}\right\}$ satisfying: a) strong consistency: $\widehat{\boldsymbol{\theta}}_{n} \rightarrow \boldsymbol{\theta}$ as $n \rightarrow \infty$, and b) asymptotic normality and efficiency: $\widehat{\boldsymbol{\theta}}_{n}$ is $A N\left(\boldsymbol{\theta}, \boldsymbol{n}^{\mathbf{1}} \boldsymbol{I}_{\boldsymbol{\theta}}^{\mathbf{1}}\right)$, where the information matrix

$$
I_{\boldsymbol{\theta}}=\left[E_{G_{\kappa}}\left\{\left(\left(\ln g_{\kappa}\right)_{\left(\theta_{i}\right)}\right)\left(\left(\ln g_{\kappa}\right)_{\left(\theta_{j}\right)}\right)\right\}\right] .
$$

## 4. Simulation Results

A simulation study was conducted to evaluate the joint asymptotic efficiency of the MLE's of the parameters of the GLLE distribution. Without loss of generality, we chose the scale parameter to be 1 . The chosen values of the transformation parameter were 3.0, $2.0,1.5,1.0,0.5$, and 0.25 . The simulation study contained two parts. In the first part, the MLE's and their variances were simulated. In the second part, we evaluated the CramerRao Lower Bound (CRLB) by simulating the information matrix. The results were compared to decide whether the variances of the MLE's tended to approach the CRLB.

Let $U \sim$ Uniform $(0,1)$. To generate a random variate from a $\operatorname{GLLE}(\lambda, \kappa)$ distribution, with chosen values for $\lambda$ and $\kappa$, we set

$$
u=\frac{\left(e^{\lambda x}-1\right)^{\kappa}}{1+\left(e^{\lambda x}-1\right)^{\kappa}}
$$

and invert, obtaining $x=\frac{1}{\lambda} \ln \left(1+\left(\frac{u}{1-u}\right)^{1 / \kappa}\right)$. We substitute n generated values of U into this equation to obtain a simulated random sample of size $n$ from a $\operatorname{GLLE}(\lambda, \kappa)$ distribution.

In terms of the baseline and composite distributions, the likelihood equations are:

$$
\frac{\partial l}{\partial \kappa}=\frac{n}{\kappa}+\sum_{i=1}^{n} \ln \left(G\left(x_{i}\right)\right)-\lambda \sum_{i=1}^{n} x_{i}-2 \sum_{i=1}^{n} \ln \left(G\left(x_{i}\right)\right) G_{\kappa}\left(x_{i}\right)+2 \lambda \sum_{i=1}^{n} x_{i} \bar{G}_{\kappa}\left(x_{i}\right),
$$

and

$$
\frac{\partial l}{\partial \lambda}=\frac{n}{\lambda}+(\kappa-1) \sum_{i=1}^{n} \frac{x_{i} \bar{G}\left(x_{i}\right)}{G\left(x_{i}\right)}-\kappa \sum_{i=1}^{n} x_{i}-2 \kappa \sum_{i=1}^{n} \frac{x_{i} \bar{G}\left(x_{i}\right)}{G\left(x_{i}\right)} G_{\kappa}\left(x_{i}\right)+2 \kappa \sum_{i=1}^{n} x_{i} \overline{\mathrm{G}}_{\kappa}\left(x_{i}\right) .
$$

These were set equal to 0 and solved numerically to find the MLE's.
The algorithm for simulating the MLE's and estimated covariance matrix:

1. Generate a random sample of size $n$ from a GLLE distribution.
2. Calculate the MLE's.
3. Repeat the first two steps 1000 times.
4. Calculate the estimated covariance matrix.

The algorithm for evaluating the CRLB:

1. Generate a random variate from a GLLE distribution with given scale parameter and transformation parameter.
2. Evaluate the squares of the first partial derivatives of the logarithm of the density function with respect to the two respective parameters, and the product of the two first partial derivatives.
3. Repeat the first two steps 5000 times.
4. Find the averages of the above three quantities to estimate the four elements of the Fisher information matrix.
5. Invert the matrix and multiply the diagonal elements by $1 / \mathrm{n}$ to obtain the estimated CRLB.

The results of the simulation are presented in the tables below. Tables 1 to 6 present the simulation results for the MLE's and estimated variances for both parameters. Tables 7 to 12 present the differences between the estimated variances and the corresponding CRLB's.

From examination of the tabulated results, it is apparent that both estimators tend to overestimate the parameters slightly. There appears to be a somewhat stronger tendency for $\hat{\kappa}$ to overestimate.

It is clear that the estimated variances approach the CRLB as the sample size increases, albeit somewhat slowly. We were unable to assess the efficiency for $\kappa=$ $0.25, \lambda=1.0$, since we were unable to compute the CRLB for that case.

## 6. Conclusion.

We have proved that, for any positive value of the scale parameter and for any value of the transformation parameter exceeding 1, the Generalized Log-Logistic Exponential distribution family satisfies the standard regularity conditions. Hence, the MLE's of the parameters, in this parameter space, are strongly consistent and jointly asymptotically normally distributed and efficient.

In addition, the simulation results imply that the MLE's are jointly efficient, with the variances of the estimators approaching the Cramer-Rao Lower Bounds, not only for the parameter values in the space mentioned in the preceding paragraph, but also for some values of the transformation parameter less than 1 . Only for $\kappa=0.25$ were we unable to assess the asymptotic efficiency.

Some practical implications of these results are that standard normally-based statistical inferential procedures may be used in situations in which a GLLE distribution appears to provide a good fit to a data set. For example, in Section 1, it was mentioned that Gleaton and Lynch (2010) found that a GLLE distribution appeared to provide a better fit than a 2-parameter Weibull distribution to a data set consisting of measured tensile breaking strengths of a sample of $n=64$ ten-millimeter-long carbon fibers.

## Appendix I: Lemmas

Lemma 1: Let $G(x)=\left(1-e^{-\lambda x}\right) I_{(0,+\infty)}(x)$, for $\lambda \geq 0$, and let $G_{\kappa}(x)=\Lambda_{\kappa}(G(x))$. Then, for $\kappa \geq 1$, we have
a) $\left[(G(x))^{\kappa}+(\bar{G}(x))^{\kappa}\right]^{-1} \leq 2^{\kappa-1}$, and
b) $0 \leq g_{\kappa}(x)=G_{\kappa}{ }^{\prime}(x) \leq 2^{2(\kappa-1)} \kappa \lambda$.

Proof: Assume that $\kappa \geq 1$. Let $u=\left(1-e^{-\lambda x}\right) I_{(0,+\infty)}(x), \bar{u}=1-u$, and let

$$
h_{\kappa}(u)=u^{\kappa}+\bar{u}^{\kappa} .
$$

We have $\lim _{u \downarrow 0} h_{\kappa}(u)=\lim _{u \rightarrow 1} h_{\kappa}(u)=1$, and $h_{\kappa}(0.5)=2^{-(\kappa-1)} \leq 1$, with $h_{\kappa}(0.5)=1$ if and only if $\kappa=1$.
Differentiating, we have

$$
h_{\kappa}^{\prime}(u)=\kappa\left(u^{\kappa-1}-\bar{u}^{\kappa-1}\right) .
$$

Now, $h_{\kappa}^{\prime}(0.5)=0$. In addition, it is clear that, for $0<u<0.5, h_{\kappa}^{\prime}(u)<0$, and that for $0.5<u<1, h_{\kappa}^{\prime}(u)>0$. Since $h_{\kappa}(u)$ is differentiable on the unit interval, it follows that $h_{\kappa}(u)$ has a minimum at $u=0.5$. Thus, $h_{\kappa}(u) \geq 2^{-(\kappa-1)}$, or $\left(h_{\kappa}(u)\right)^{-1} \leq 2^{(\kappa-1)}$.

For $\kappa \geq 1$, it is clear that $u^{\kappa-1} \leq 1$ and that $\bar{u}^{\kappa} \leq 1$ Then, using the result above, we have

$$
g_{\kappa}(u)=\frac{\kappa \lambda u^{\kappa-1} \bar{u}^{\kappa}}{\left(u^{\kappa}+\bar{u}^{\kappa}\right)^{2}} \leq 2^{2(\kappa-1)} \kappa \lambda .
$$

Lemma 2: Let $\kappa \geq 1$, let $\Lambda_{\kappa}(u)=\frac{u^{\kappa}}{u^{\kappa}+\bar{u}^{\kappa}} I_{(0,1)}(u)$, and $\bar{\Lambda}_{\kappa}(u)=1-\Lambda_{\kappa}(u)=\Lambda_{\kappa}(\bar{u})$.
Then, for any positive integers $\mathrm{n}, \mathrm{m}$, there exists positive constants $A_{n m}$ and $\beta_{m}$ such that

$$
\Lambda_{\kappa}^{n}(G(x)) \Lambda_{\kappa}^{m}(\bar{G}(x)) \leq A_{n m} e^{-\beta_{m} x}
$$

for all $x$.
Proof: Let $\kappa \geq 1$, and let n , m be positive integers. We have

$$
\Lambda_{\kappa}^{n}(G(x)) \Lambda_{\kappa}^{m}(\bar{G}(x))=\frac{(G(x))^{n \kappa}(\bar{G}(x))^{m \kappa}}{\left((G(x))^{\kappa}+(\bar{G}(x))^{\kappa}\right)^{n+m}}
$$

Now, $0 \leq G(x) \leq 1$, so that $0 \leq(G(x))^{n \kappa} \leq 1$, and

$$
\Lambda_{\kappa}^{n}(G(x)) \Lambda_{\kappa}^{m}(\bar{G}(x)) \leq \frac{(\bar{G}(x))^{m \kappa}}{\left((G(x))^{\kappa}+(\bar{G}(x))^{\kappa}\right)^{n+m}} .
$$

Using part (a) of Lemma 1 , we have

$$
\Lambda_{\kappa}^{n}(G(x)) \Lambda_{\kappa}^{m}(\bar{G}(x)) \leq 2^{(n+m)(\kappa-1)}(\bar{G}(x))^{m \kappa}=2^{(n+m)(\kappa-1)} e^{-m \kappa}
$$

for all $x$. Thus, $A_{n m}=2^{(n+m)(\kappa-1)}$, and $\beta_{m}=m \kappa \lambda$.
LEMMA 3: The functions $\eta(x)=x \frac{\bar{G}(x)}{G(x)}, v(x)=x^{2} \frac{\bar{G}(x)}{(G(x))^{2}}, \rho(x)=x^{2} \frac{\bar{G}(x)}{G(x)}$, and $\tau(x)=$ $x^{3} \frac{\bar{G}(x)}{(G(x))^{2}}$ are bounded.
Proof: It is straightforward to show, using L'Hopital's Rule, that

$$
\lim _{x \rightarrow \infty} \eta(x)=0, \lim _{x \rightarrow \infty} v(x)=0, \lim _{x \rightarrow \infty} \rho(x)=0, \lim _{x \rightarrow \infty} \tau(x)=0
$$

and that

$$
\lim _{x \downarrow 0} \eta(x)=\frac{1}{\lambda}, \lim _{x \downarrow 0} v(x)=\frac{1}{\lambda^{2}}, \lim _{x \downarrow 0} \rho(x)=0, \lim _{x \downarrow 0} \tau(x)=0 .
$$

Each function is non-negative, bounded, and continuously differentiable on $(0,+\infty)$. Thus, they have maxima, $M_{\eta}, M_{\nu}, M_{\rho}$, and $M_{\tau}$, respectively.

Lemma 4: If $\kappa \geq 1$, then for any positive integers n and m , the functions
i) $\varphi_{1 n}(x)=g_{\kappa}(x)|\ln (G(x))|^{n}, \quad$ ii) $\varphi_{2 n}(x)=g_{\kappa}(x)|\ln (\bar{G}(x))|^{n}$,
iii) $\varphi_{3 n m}(x)=x^{m} g_{\kappa}(x)|\ln (G(x))|^{n}$, and iv) $\varphi_{4 n m}(x)=x^{m} g_{\kappa}(x)|\ln (\bar{G}(x))|^{n}$ are integrable for $\kappa \geq 1$.
Proof:
i) Using the change of variable $u=G(x)=1-e^{-\lambda x}$, it is straightforward to show that, for $\kappa \geq 1$ and using Lemma 1 and Gradshteyn (2015), we have
$\int_{0}^{\infty} \varphi_{1 n}(x) d x=\kappa \int_{0}^{1} \frac{1}{u \bar{u}} \Lambda_{\kappa}(u) \Lambda_{\kappa}(\bar{u})|\ln (u)|^{n} d u \leq \kappa 2^{2 \kappa-2} \int_{0}^{1}|\ln (u)|^{n} d u=\kappa 2^{2 \kappa-2} n!$.
ii) Similarly, letting $u=\bar{G}(x)=e^{-\lambda x}$, we find

$$
\int_{0}^{\infty} \varphi_{2 n}(x) d x \leq \kappa 2^{2 \kappa-2} n!
$$

iii) The common class median of the distribution is $m=\frac{\ln (2)}{\lambda}$. If we let $u=$ $G(x)=1-e^{-\lambda x}$, then, using Lemma 1 and Gradshteyn (2015), we have

$$
\int_{0}^{\infty} \varphi_{3 n m}(x) d x=\kappa 2^{2 \kappa-2} \int_{0}^{1}|\ln (u)|^{n}|\ln (\bar{u})|^{m} d u
$$

For $0<u<0.5$, we have $|\ln (\bar{u})| \leq \ln (2)$, so that, using Gradshteyn (2015), we have
$\int_{0}^{m} \varphi_{3 n m}(x) d x \leq \kappa 2^{2 \kappa-2}(\ln (2))^{m} \int_{0}^{0.5}|\ln (u)|^{n} d u \leq \kappa 2^{2 \kappa-2}(\ln (2))^{m} n!$.
For $0.5<u<1$, we have $|\ln (u)| \leq \ln (2)$, so that, using Gradshteyn (2015), we have

$$
\int_{m}^{\infty} \varphi_{3 n m}(x) d x \leq \kappa 2^{2 \kappa-2}(\ln (2))^{n} \int_{0.5}^{1}|\ln (\bar{u})|^{m} d u \leq \kappa 2^{2 \kappa-2}(\ln (2))^{n} m!
$$

Hence,

$$
\int_{0}^{\infty} \varphi_{3 n m}(x) d x \leq \kappa 2^{2 \kappa-2}\left[(\ln (2))^{m} n!+(\ln (2))^{n} m!\right]
$$

iv) Similarly, if we let $u=\bar{G}(x)=e^{-\lambda}$ and use Lemma 1 and Gradshteyn (2015), we have

$$
\int_{0}^{\infty} \varphi_{4 n}(x) d x \leq \kappa 2^{2 \kappa-2}\left[(\ln (2))^{m} n!+(\ln (2))^{n} m!\right] .
$$

Lemma 5: Let $n$ be a positive integer. Let $a$ and $b$ be real numbers with $a>b$. Then the following function is integrable:

$$
f_{n}(x)=\frac{x^{n} e^{-a x}}{1-e^{-b x}} I_{(0, \infty)}(x)
$$

Proof: First, it will be shown that the (strictly positive) function is bounded above. Then, it will be shown that the tail of the function is bounded by an integrable function.

First, we have

$$
\lim _{x \rightarrow \infty} f_{n}(x)=0
$$

Then, using L'Hopital's Rule, we find that

$$
\lim _{x \downarrow 0} f_{n}(x)=\left\{\begin{array}{l}
\frac{1}{\lambda}, \text { for } n=1, \text { or } \\
0, \text { for } n>1
\end{array}\right.
$$

Then, since the function is strictly positive and continuously differentiable, it is bounded above.

Next, let $x_{0}>0$. Then, we have

$$
\int_{x_{0}}^{\infty} f_{n}(x) d x \leq \frac{1}{1-e^{-b x_{0}}} \int_{0}^{\infty} x^{n} e^{-a x} d x=\frac{\Gamma(n+1)}{a^{n+1}\left(1-e^{-b x_{0}}\right)}
$$
